

CB Window Preview Class Guide

Install instructions are at the end. Near the end are also the instructions for adding the Class to a live (non-preview) Window to Inspect at runtime.

When you generate a Window Preview hover your mouse at the Top-Left and a Secret Flat button will popup. If you specified Init(2) the button will be full width (as pictured). The tooltip will tell you when the Preview was made and its name. Click the Button to open up the List of Controls.

The Check boxes on the left allow Unhide, Enable, Un-ReadOnly, UnSkip Individual controls. The ALL button allows doing them all in one shot. You can hold down Control + Click on the ALL button to "Uncheck ALL":

List of Controls

The first and main window to open is the list of controls as shown below. You can right click on the list for a popup menu. The buttons and checks have tool tips to explain their use.

CB wininspect - Controls: Form 1. (Built: 6:16:50 - Run: 6:19)

All Lists in the tool have column sorting and color the sorted column blue. The sorting is 2 level with the prior column being the second sort, e.g. click in X column to sort by X, then click on Y and it will be sorted by Y, then X so down and across.

The Position section leaves blank parameters that are default or full. One thing I find a problem on tight windows are ENTRY controls without a width (default), here those would show as blank and could be sorted.

The LIST button pops up with all list controls so that I do not have to scroll to find them. Selecting them brings up the LIST Format window from which you can click PROP to see the LIST Properties.

Add Developer Tool Tips to Controls and Columns

Fix ####.## Numbers

Remove Blank from Pictures @nB @dB @tB

Make all LIST Columns Sizable

Delete PROMPT and STRING from below List of Controls

Edit Window Caption

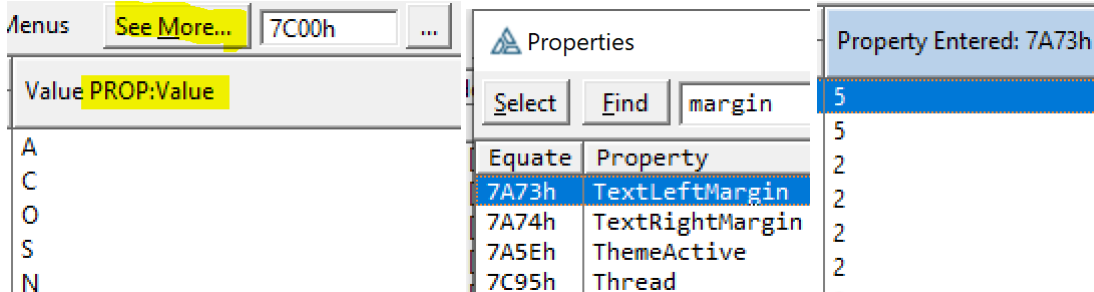

Save Preview EXE so not lost on Close

The Tricks menu has several common things I think to do:

PROP: Inspect (Property Introspection / Reflection)

A big part of the tool is to be able to see the PROPs of a Control, Window or System, and their values. Many times before I use a PROP:xxx I want to see what kind of values it has so I write some code. With this tool you can see the values without having to write code.

See More – Lets you see the same property for all controls on the window. The [...] button has a picker.

Properties for Controls, Lists, Windows, System: You get to these with buttons or right-click or double click. The LIST Props are really List FORMAT properties.

Control PROP: - Right click on any control and select Control Props. You can also double click on the control, except there is the “C Rsz2M” check box ☐ C Rsz2M that makes double click open the resizer. For many of the PROPs there is an “explainer” e.g. FEQ numbers show the name; Colors show the Color:Equate.

Tricks Button: Developer Tool Tips

After clicking the button close the WInspect Controls list and on your Window you'll find tool tips added to each control with some info useful to the developer. I frequently need to know the Value() assigned in a CHECK, OPTION or FROM List so its in the See More popup. I frequently need to know the Use variable. In a preview the USE() are all V## so not helpful. In a live program they will be better tips. The Tip shows the Previous and Follows controls, usually one of them will be a Prompt() with the USE() variable + ":Prompt":

List has tip over Header, and each Column has a tip.

Resizer / WYSIWYG Designer

Resizer is on Right Click menu. If you check the "C Rsz2M" box then double-click on a Control will open the Resizer.

Below you see a Group around some buttons as it appeared fine in Designer but then at runtime it is shifted down.

NOTE: That sizes and placement are different with Visual Styles so be sure you have VS turned ON in Designer.

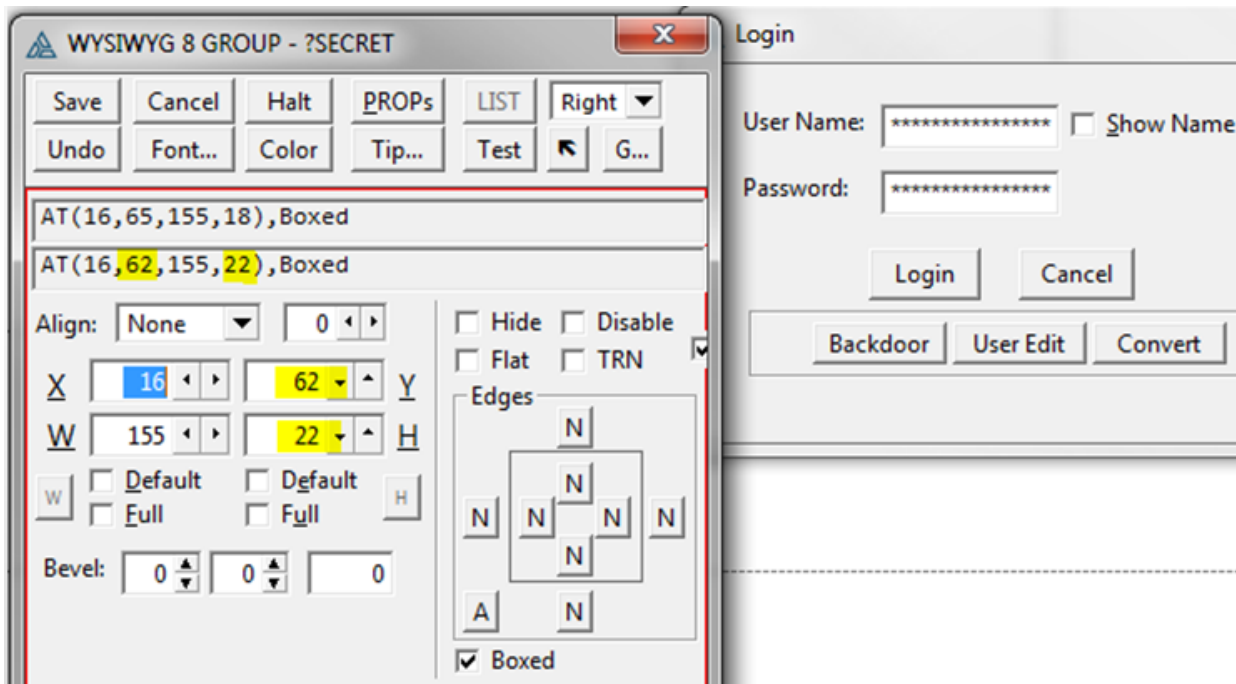

Designer ok:

Not Preview:

In the Resizer the Y is changed from 65 to 62, and the Height from 18 to 22 to make it right.

Hover over the controls in the resizer for tool tips. Hot Keys for Resize are Shift+Arrows, for Move are Ctrl+Arrows.

Example of a Window section that needed tight spacing. To get this many controls perfected can take many round trips of preview, adjust in designer, preview. Using the Preview Class Resizer you can get it perfect in one try. It is tedious and you do have to re-enter the corrected AT() into designer, but you get it perfect in one try.

Before (compare the bottom row left size e.g. third in “Brd. Trs”. Sorry many are missing TRN in before)

System Menu

Nearly every window has the below System Menu:

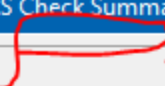

CLOSE Windows back to the Preview	The tool can open a series of windows. This closes them all to get to the original preview window.
RUN ANOTHER Instance of this Preview	Rather than do the above and close back to the preview ... you can run another instance and leave the original one right where it started.
MOVE Windows to Position Under this One	Moves the under windows to be the under the one with focus
HIDE Windows UNDER this One	Hides all unders leaving just the this top once visible. As soon as you close this window they unhide. If you select this menu item again they unhide.
Hide PREVIEW Window	Just hide the preview window. As soon as you close this window it will unhide. If you select this menu item again it will unhide.
Kill WINDOW Previews with this Caption	I can have a lot of previews open. This uses TaskKill to shutdown those with this caption
KILL ALL Preview EXEs	Runs TaskKill for all WinPreview---.exe
HALT THIS Preview Only	Simply does a HALT to kill the current preview.

Content from an Older document, some screens may have changed

When you have a preview up and hover the mouse over the top of the window a secret button pops up to let you open CBWndPreview. See below the button is across the entire width the window.

This is a work in progress. There is more I will add e.g. LIST FORMAT viewer. I have gotten distracted by some cute little things that need to be removed. The code needs cleanup. It has been developed mostly at night.

It can be used on a live window at runtime by adding about 3 lines of code to a procedure.

I think I can hook the help engine to get it on any window without adding any per window code.

Add Class to Window Procedure to See at Runtime

The Class can easily be added to a live Window Procedure and see the properties at runtime. Possibly your code changed PROPs. Things like LIST Styles are not available until runtime. I would suggest you only create the class when a hot key is pressed and probably only if it is on a develop machine or it is a backdoor user. You don't want users accidentally in this.

1. Include the class in Global: <code>INCLUDE('CbWndPreview.INC'),ONCE</code>	2.
3. Declare in Window Procedure:	4.

1. Include the class in Global	<code>INCLUDE('CbWndPreview.INC'),ONCE</code>
2. Declare in Window Procedure	<code>CbWndPrv &CBWndPreviewClass</code>
3. Window add an Alert Key	<code>Window WINDOW('Form'),AT(,,99,994), ALRT(CtrlShiftW)</code>
4. OF Event:AlertKey	<pre> IF KEYCODE()=CtrlShiftW THEN IF CbWndPrv &= NULL THEN CbWndPrv &= NEW(CBWndPreviewClass) CbWndPrv.Init() END !ELSE CbWndPrv.Reflection() !Display on Hit Key END </pre>
5. Close Window. Not required, you'll leak a little memory but its for debug.	<code>IF NOT CbWndPrv &= NULL THEN DISPOSE(CbWndPrv).</code>

Install Instructions

1. Open your "LIBSRC" folder usually C:\Clarion11\Accessory\LibSrc\Win folder
2. Copy the CBWndPreview* CLW and INC files into LIBSRC
3. Create a WindowPreviewer.INC like below in LIBSRC. The IDE New Source has a Template for WindowPreviewer.INC you can paste in just few yellow highlighted lines.

WindowPreviewer.INC
<pre>SECTION('Includes') !Put variable and equate declarations here INCLUDE('CBWndPreview.INC'),ONCE FixNum BYTE !Must wait to fix number until InAccept. WndPrvCls CBWndPreviewClass !----- SECTION('AfterOpen') !Put code that needs to be executed after the window is opened, but before entering the ACCEPT loop WndPrvCls.Init(2) !2=Secret Button Across Top; 1=Upper Left Corner 8x8 !Optional--> WndPrvCls.AllOffFHDRS(1,0,0,0) !All controls 1=Turn off (Hide,Disable,Readonly,Skip) - Not done if Ctrl key down 0{PROP:System} = 1 !Carl likes a SYSTEM Menu to close window because below set: windowPreviewerCanExit__=False !----- SECTION('InAccept') !Optional--> IF ~FixNum THEN FixNum=1 ; WndPrvCls.AllFixNumbers() ; END !Fix Previewer ####.## numbers to 9999.99 windowPreviewerCanExit__ = FALSE !Carl likes button click NOT closing window to test Alt+Keys. Escape or SYSTEM Red X will Close. !Put code here that is executed at the top of the ACCEPT loop !if you set windowPreviewerCanExit__ to FALSE, the generated code will not !check to see if a button was pressed and exit the preview !Note that windowPreviewerCanExit__ is reset to TRUE every iteration of the ACCEPT loop</pre>

- 4.
- 5.
